DNA encoding plant citrate synthase - used to regulate flower formation, to improve storage of tubers, etc. and to reduce sprouting claim 7: Page 60-63: 87pp; Bnglish.

To identify a cDNA from tobacco which codes for citrate synthase, a cDNA bank of leaf tissue from tobacco was prepd. Plaques of this cDNA bank were screened using a radioactive DNA probe which comprises Solanum tuberosum citrate synthase cDNA probe which comprises Solanum tuberosum citrate synthase cDNA (704199), one of the clones was sequenced. The nt. sequence is sequence 1747 Bp; 490 A; 335 C; 400 G; 522 T; (AGRE ) HOECHST-SCHERING AGREVO GMBH. La Cognata U, Landschutze V, Muller-rober B, Landschuetze 25-JAN-1996 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          220 cctgaacaacaggatcgcctgaaaaagatcaagtcagat-atg-aaaggttcaattggga 277
to improve storage of tubers, etc. and to reduce sprouting claim 5; Page 53-56; B7pp; English.

To identify a cDNA from potato which codes for citrate synthase, a cDNA fragment of citrate synthase from Arabidopsis thaliana was firstly amplified using A.thaliana cDNA and oligos T04202 and T04203 which are complementary to the 5' or 3' end of the coding region of introduce BamHI clavage sites at both ends of the amplified cDNA for citrate synthase. The oligos additionally introduce BamHI clavage sites at both ends of the amplified cDNA fragment. a cDNA library was prepd. from potato leaves and screened with A. thaliana citrate synthase cDNA. Positive clones were purified and sequenced. Then t sequence is given in T04199.

also new CS sense and anti-sense DNA sequences
Claim 6; Page 15-19; 35pp; German.
The potato citrate synthase (CS) gene or CDNA sequence encoding CS
(T03410) may be used to produce antisense CS sequences. CS DNA
sequences are useful for altering CS activity in plants. Antisense
CS sequences can be used to inhibit CS expression in plants and has
the effect of inhibiting flower formation and by doing so improves
the plant's storage capacity. This is partic. useful in crop plants
of any kind but esp. useful in potatoes. In addition to altering CS
activity the DNA sequences can also be used to identify similar
sequences in the genomes of other plants and in the production of
transgenic plants with altered CS activity.

       To identify a cDNA from sugar beet which codes for citrate synthase, a cDNA bank of leaf tissue from sugar beet was prepd. Plaques of this cDNA bank were screened using radioactive DNA probes which comprise a mixture of Solanum tuberosum citrate synthase cDNA (104199) and Nicotian tabacum citrate synthase cDNA (see T04201). One of the clones was sequenced. The nt. sequence is given in 104200.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mistincipolation of misterials and streening.
Random point mutations were introduced into the alpha fragment of
E.coli beta-galactosidase. The wild type sequence was obtained as a
E.coli beta-galactosidase. The wild type sequence was obtained as a
E.coli beta-galactosidase. The wild type sequence was obtained as a
E.coli beta-galactosidase. The wild type sequence was obtained as a
E.coli beta-galactosidase. The wild type sequence was obtained as a
E.coli beta-galactosidase. The wild type securical caping the molecules which terminate at all
possible nucleotide positions within a specified region. The
variable 3' ends generated in this way are used as primers for reverse transcriptase. Mucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system.
The sequence covers all 176 difft base substitutions, most of which See also PB0575.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

25 Claim 1, Page 64-67, 90pp; English.

26 Claim 1, Page 64-67, 90pp; English.

27 A partial CDNA clone (T31478) codes for a spinach debranching enzyme (DE) (R98371) useful for modifying the branching degree of amylopectin synthesised in plants. It was obtd. by PCR amplification of CDNA (From a spinach leaf CDNA library using probes (T31480-81) based on CF from a spinach leaf CDNA library using probes (T31480-81) based on CF peptides (R98385-86). The clone can be incorporated into a vector and used for prodn. of recombinant DE, or used in the breeding of transgenic plants, transgenic potatoes showed increased be activity properties. Ribozyme or antisense sequences can be used to reduce the DE activity of transgenic plants. The modified starches have clood and industrial applies.

26 Cod and industrial applies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               751 TACAAGAACGCAACACTATACCTAAGGATGACTCACTGGATTATGGTGCAAATTTTGCT 810

                                                              Introducing random point mutations into nucleic acods -
by prepn of single stranded template, annealing a primer, elongation,
misincorporation, completion of molecules and screening.
Disclosure, p. English.
                                                                                                                                                                         E.coli beta galactosidase. The wild type sequence was obtained as single stranded template and an oligonucleotide was hybridised to it to generate a popp of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are misincorporated by the amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which See also P89575.

The SMM gene is a chromosome 5-SMA (Spinal Muscular Atrophy) determining gene. Sequences of clone T-BCD541 and clone C-BCD541 are provided in T28255 and T28259, respectively.
SMN sequences can be used for detecting neuron disorders having symptoms of muscular weakness with or without sensory changes such as amytrophic lateral sclerosis (ALS), SMA, primary lateral

New isolated survival motor neuron gene - used to develop prods. for the diagnosis and treatment of motor neuron diseases.
Claim 4: Fig 2A; 29pp: English.

The SMN gene is a chromosome 5-SMA (Spinal Muscular Atrophy)
determining gene. Sequences of clone T-BCD541 and clone C-BCD541
are provided in T28255 and T28259, respectively.
SMN sequences can be used for detecting neuron disorders having symptoms of muscular weakness with or without sensory changes such as amytrophic lateral sclerosis (ALS), SMA, primary lateral Sclerosis (PLS), etc.
Scquence 1582 BP; 562 A; 285 C; 335 G; 400 T;

A cDNA sequence (T18828) was detd. for the human survival motor neuron (SMN) gene T-BCD541 (see also T18868). This telomeric gene is responsible for motor neuron diseases of the spinal muscular atrophy (SMA) type. The SMN gene is lacking or truncated in 98% of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        atrophy (SWA) type. The SMN gene is lacking or truncated in 98% of SWA patients. The gene was discovered using a complex system of restriction mapping, distinguishing the Erel from the Eren by Southern blot, and determination of the differences between the Erel in SMA patients by genetic and physical mapping. It can be used in gene therapy protocols to correct disorders present in SMA, anthropylosis multiplex congenita patients, to produce large quantities of recombinant SMN protein (see also R94963), and to design probes and primers (118833-65) useful for detecting or
                                                                                                                                                                                                                                                       Human survival motor neuron gene T-BCD541, variant C-BCD541 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    402 T;

A CDNA sequence (T18831) was detd. for the human survival motor neuron (SMN) variant gene C-BCD541. This centromeric gene differs from the SMN telomeric gene cDNA clone T-BCD541 (T18828) by a nucleocides. The C-BCD541 gene is unable to correct in vivo a deficiency of the T-BCD541 gene responsible for motor neuron diseases of the spinal muscular atrophy type. A variation
                                                                                                                                                                                                            Human survival motor neuron variant gene cDNA clone C-BCD541.
Survival motor neuron gene: SNN gene: spinal muscular atrophy:
chromosome 5-SNA determining gene; amytrophic lateral sclerosis;
primary lateral sclerosis; arthrogryposis multiplex congenita;
diagnosis; gene therapy; C-BCD541; ss.

This sequence encodes the human BA0306 membrane protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                             17-DEC-1998 (first entry)
Human membrane protein BA0306 coding sequence.
Membrane protein; BA0306; BA2303; arteriosclerosis; coronary restenosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention also relates to the human BA2303 membrane protein. The two membrane proteins are specifically expressed in mammals during
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   arteriosclerosis and coronary restenosis. The membrane proteins, fragments of them, and antibodies against them are useful in the treatment and prevention of arteriosclerosis and restenosis. Transgenic mice expressing the extracellular region of the membrane proteins are useful as models for studying these disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Pathological conditions can be also diagnosec. By determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, tumours, leukemias, diseases of the immune system, autoimmune disorders, hepatic and renal diseases, lymphomas, inflammation, allergies, ischemic shock, Alzheimer's and cognitive disorders involving osteoclasts such as osteopororsis, arthritis or malignancies, diseases of testes, lung the manner of diseases of the time.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders disorders. Immune diseases, inflammation or blood disorders disorders claim 4; Page 440-441; 772pp; English.

The invention relates to nucleic acid sequences (V84411 to V84633) encoding human secreted proteins (W88534 to W88756). The secreted protein gene sequences are deposited with the ATCC under deposit numbers ATCC 209011, 209080, 209081, 209082, 209087, 209008, 209009, 209010, 209011, 209081, 209081, 209083, 209084, 209085, 209511. Host sequences are used for the recombinant production of the secreted proteins. The polynucleotide and amino acid sequences are useful for are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or thymus, digestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding pattners. The present sequence represents a gene encoding a human secreted protein (see descriptor line for gene number and clone identification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        P-PSDB; W88711, W89037, W89038, W89039, W89040.
New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (HUMA-) HUMAN GENOME SCI INC.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 97, Application US/08478675
Patent No. 5773246
GENERAL INFORMATION:
PAPLICANT: KEDNE, JACK D.
APPLICANT: KING, PETER H.
APPLICANT: LEVINE, TODD
TITLE OF INVENTION: METHODS AND COMPOSITIONS USEFUL IN THE
TITLE OF INVENTION: PECOGNITION, BINDING AND EXPRESSION OF PIBONUCLET: ACIDS
TITLE OF INVENTION: INVOLVED IN CELL GROWTH, NEOPLASIA AND IMMUNOREGILATION
NUMBER OF SEQUENCES: 101
CORRESPONDENCE ADDRESS:

/octail and columnia zip-Lox; Site_1: Sal; Site_2: Not: lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 quantities of 6 4 pools of mRNA. The mRNA sources were 1) 7 quantities of 6 4 pools of mRNA sources were 1) 7 quown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dr primed CDNA. [Ab_xref="faxon:3702"]

/note-"vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; Lambda PRL2 is a CDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark- rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and sliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA.

Inhibiting citrate synthase (CS) activity in plants - to inhibit Inhibiting citrate synthase (CS) activity in plants - to inhibit also new CS sense and anti-sense DNA sequences.

The flower formation and improve storage capacity, e.g. in potatoes, also new CS sense and anti-sense DNA sequences.

Claim 5; Page 15-19; 35pp; German.

The potato citrate synthase (CS) gene or CDNA sequence encoding CS (T03410) may be used to produce antisense CS sequences. CS DNA sequences are useful for altering CS activity in plants. Antisense CS sequences are be used to inhibit CS expression in plants and has the effect of inhibiting flower formation and by doing so improves the plant's storage capacity. This is partic. useful in crop plants of any kind but esp. useful in potatoes. In addition to altering CS activity the DNA sequences can also be used to identify similar sequences in the genomes of other plants and in the production of transgenic plants with altered CS activity. This sequence in represents the amino acid sequence of potato citrate synthase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      firstly amplified using A thaliana cDNA and oligos T04202 and T04203 which are complementary to the 5' or 3' end of the coding region of A. thaliana cDNA for citrate synthase. The oligos additionally introduce BamHI cleavage sites at both ends of the amplified cDNA fragment. a CDNA library was prepd. from potato leaves and screened with A. thaliana citrate synthase cDNA. Positive clones were purified and sequenced. The nt sequence is given in T04199.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 mvfyrsvsllsklrsravgqsnvsnsvrwlqvqtssgldlrselvqelipeggdrlkkik 60

To identify a cDNA from sugar beet which codes for citrate synthase, a cDNA bank of leaf tissue from sugar beet was prepd. Plaques of this cDNA bank were screened using radioactive DNA probes which comprise a mixture of Solanum tuberosum citrate synthase cDNA (104199) and Micotian tabacum citrate synthase cDNA (see 10420)). One of the clones was sequenced. The nt. sequence is
